Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
 GROS may not be used when kstar of detected data is small such as < 0.1
 For such situations, GROS method tends to yield inflated values of UCLs and BTVs
 For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Maximum	7.01	Median	0.01

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.
